Introduction

- **Operator overloading**
 - Enabling C++'s operators to work with class objects
 - Using traditional operators with user-defined objects
 - Requires great care; when overloading is misused, program difficult to understand
 - Examples of already overloaded operators
 - Operator `<<` is both the stream-insertion operator and the bitwise left-shift operator
 - `+` and `-`, perform arithmetic on multiple types
 - Compiler generates the appropriate code based on the manner in which the operator is used

© 2000 Prentice Hall, Inc. All rights reserved.

Fundamentals of Operator Overloading

- Overloading an operator
 - Write function definition as normal
 - Function name is keyword **operator** followed by the symbol for the operator being overloaded
 - **operator+** used to overload the addition operator (+)
- Using operators
 - To use an operator on a class object it must be overloaded unless the assignment operator (=) or the address operator (&)
 - Assignment operator by default performs memberwise assignment
 - Address operator (&) by default returns the address of an object

© 2000 Prentice Hall, Inc. All rights reserved.

Restrictions on Operator Overloading

- C++ operators that can be overloaded

Operators that can be overloaded							
+	-	*	/	%	^	&	
~	!	=	<	>	+ =	- =	* =
/ =	% =	^ =	& =	=	<<	>>	>> =
<<=	==	!=	<=	>=	&&		++
--	->*	,	->	[]	()	new	delete
new[]	delete[]						

- C++ Operators that cannot be overloaded

Operators that cannot be overloaded				
.	* .	::	? :	sizeof

© 2000 Prentice Hall, Inc. All rights reserved.

Restrictions on Operator Overloading

- Overloading restrictions
 - Precedence of an operator cannot be changed
 - Associativity of an operator cannot be changed
 - Arity (number of operands) cannot be changed
 - Unary operators remain unary, and binary operators remain binary
 - Operators `&`, `*`, `+` and `-` each have unary and binary versions
 - Unary and binary versions can be overloaded separately
- No new operators can be created
 - Use only existing operators
- No overloading operators for built-in types
 - Cannot change how two integers are added
 - Produces a syntax error

© 2000 Prentice Hall, Inc. All rights reserved.

Operator Functions as Class Members vs. as friend Functions

- Member vs non-member
 - Operator functions can be member or non-member functions
 - When overloading `()`, `[]`, `->` or any of the assignment operators, must use a member function
- Operator functions as member functions
 - Leftmost operand must be an object (or reference to an object) of the class
 - If left operand of a different type, operator function must be a non-member function
- Operator functions as non-member functions
 - Must be `friends` if needs to access private or protected members
 - Enable the operator to be commutative ($a+b$, $b+a$)

© 2000 Prentice Hall, Inc. All rights reserved.

Overloading Stream-Insertion and Stream-Extraction Operators

- Overloaded << and >> operators
 - Overloaded to perform input/output for user-defined types
 - Left operand of types **ostream &** and **istream &**
 - Must be a non-member function because left operand is not an object of the class
 - Must be a **friend** function to access private data members

© 2000 Prentice Hall, Inc. All rights reserved.

```

1 // Fig. 8.3: fig08_03.cpp
2 // Overloading the stream-insertion and
3 // stream-extraction operators.
4 #include <iostream>
5
6 using std::cout;
7 using std::cin;
8 using std::endl;
9 using std::ostream;
10 using std::istream;
11
12 #include <iomanip>
13
14 using std::setw;
15
16 class PhoneNumber {
17     friend ostream &operator<<( ostream&, const PhoneNumber & );
18     friend istream &operator>>( istream&, PhoneNumber & );
19
20 private:
21     char areaCode[ 4 ]; // 3-digit area code and null
22     char exchange[ 4 ]; // 3-digit exchange and null
23     char line[ 5 ]; // 4-digit line and null
24 };
25
26 // Overloaded stream-insertion operator (cannot be
27 // a member function if we would like to invoke it with
28 // cout << somePhoneNumber;).
29 ostream &operator<<( ostream &output, const PhoneNumber &num )
30 {

```

Outline

8

1. Class definition

1.1 Function definitions

Notice function prototypes for
overloaded operators >> and <<
They must be **friend** functions.

```

31     output << "(" << num.areaCode << " ) "
32             << num.exchange << "-" << num.line;
33     return output;      // enables cout << a << b << c;
34 }
35
36 istream &operator>>( istream &input, PhoneNumber &num )
37 {
38     input.ignore();           // skip (
39     input >> setw( 4 ) >> num.areaCode; // input area code
40     input.ignore( 2 );       // skip ) and space
41     input >> setw( 4 ) >> num.exchange; // input exchange
42     input.ignore();           // skip dash
43     input >> setw( 5 ) >> num.line;    // input line
44     return input;           // enables cin >> a >> b >> c
45 }
46
47 int main()
48 {
49     PhoneNumber phone; // create object phone
50
51     cout << "Enter phone number in the form (123) 456-7890:\n";
52
53     // cin >> phone invokes operator>> function by
54     // issuing the call operator>>( cin, phone ).  

55     cin >> phone;
56
57     // cout << phone invokes operator<< function by
58     // issuing the call operator<<( cout, phone ).
59     cout << "The phone number entered was: " << phone << endl;
60
61 }

```

Outline

9

1.1 Function definition

1.2 Initialize variables

2. Get input

The function call
cin >> phone;
 interpreted as
operator>>(cin, phone);
input is an alias for **cin**, and **num** is an alias for **phone**.

```

Enter phone number in the form (123) 456-7890:
(800) 555-1212
The phone number entered was: (800) 555-1212

```

Outline

10

Program Output

Overloading Unary Operators

- Overloading unary operators
 - Can be overloaded with no arguments or one argument
 - Should usually be implemented as member functions
 - Avoid **friend** functions and classes because they violate the encapsulation of a class
 - Example declaration as a member function:

```
class String {
public:
    bool operator!() const;
    ...
};
```

© 2000 Prentice Hall, Inc. All rights reserved.

Overloading Unary Operators

- Example declaration as a non-member function

```
class String {
    friend bool operator!( const String & )
    ...
}
```

© 2000 Prentice Hall, Inc. All rights reserved.

Overloading Binary Operators

- Overloaded Binary operators
 - Non-static member function, one argument
 - Example:

```
class String {
public:
    const String &operator+=(
```

...

```
        const String & );
};
```
 - **y += z** is equivalent to **y.operator+=(z)**

© 2000 Prentice Hall, Inc. All rights reserved.

Overloading Binary Operators

- Non-member function, two arguments
- Example:

```
class String {
    friend const String &operator+=(
```

...

```
        String &, const String & );
};
```
- **y += z** is equivalent to **operator+=(y, z)**

Case Study: An Array class

- Implement an **Array** class with
 - Range checking
 - Array assignment
 - Arrays that know their size
 - Outputting/inputting entire arrays with `<<` and `>>`
 - Array comparisons with `= =` and `!=`

© 2000 Prentice Hall, Inc. All rights reserved.

```

1 // Fig. 8.4: array1.h
2 // Simple class Array (for integers)
3 #ifndef ARRAY1_H
4 #define ARRAY1_H
5
6 #include <iostream>
7
8 using std::ostream;
9 using std::istream;
10
11 class Array {
12     friend ostream &operator<<( ostream &, const Array & );
13     friend istream &operator>>( istream &, Array & );
14 public:
15     Array( int = 10 );           // default constructor
16     Array( const Array & );    // copy constructor
17     ~Array();                  // destructor
18     int getSize() const;       // return size
19     const Array &operator=( const Array & ); // assign arrays
20     bool operator==( const Array & ) const; // compare equal
21
22     // Determine if two arrays are not equal and
23     // return true, otherwise return false (uses operator==).
24     bool operator!=( const Array &right ) const
25     { return ! ( *this == right ); }
26
27     int &operator[]( int );
28     const int &operator[]( int ) const;
29     static int getArrayCount();
30     static int arrayCount; // # of Arrays instantiated.
31 private:
32     int size; // size of the array
33     int *ptr; // pointer to first element of array
34 }
```

1.1 Function definitions

1.2 Array constructor

```

67 }
68
69 // Copy constructor for class Array
70 // must receive a reference to prevent infinite recursion
71 Array::Array( const Array &init ) : size( init.size )
72 {
73     ptr = new int[ size ]; // create space for array
74     assert( ptr != 0 ); // terminate if memory not allocated
75     ++arrayCount; // count one more object
76
77     for ( int i = 0; i < size; i++ )
78         ptr[ i ] = init.ptr[ i ]; // copy init into object
79 }
80
81 // Destructor for class Array
82 Array::~Array()
83 {
84     delete [] ptr; // reclaim space for array
85     --arrayCount; // one fewer object
86 }
87
88 // Get the size of the array
89 int Array::getSize() const { return size; }
90
91 // Overloaded assignment operator
92 // const return avoids: ( a1 = a2 ) = a3
93 const Array &Array::operator=( const Array &right )
94 {
95     if ( &right != this ) { // check for self-assignment
96
97         // for arrays of different sizes, deallocate original
98         // left side array, then allocate new left side array.
99         if ( size != right.size ) {
100             delete [] ptr; // reclaim space

```

Outline

18

1.3 Array destructor

1.4 operator= (assignment)

```

101     size = right.size;      // resize this object
102     ptr = new int[ size ]; // create space for array copy
103     assert( ptr != 0 );   // terminate if not allocated
104 }
105
106    for ( int i = 0; i < size; i++ )
107        ptr[ i ] = right.ptr[ i ]; // copy array into object
108 }
109
110    return *this; // enables x = y = z;
111}
112
113// Determine if two arrays are equal and
114// return true, otherwise return false.
115bool Array::operator==( const Array &right ) const
116{
117    if ( size != right.size )
118        return false; // arrays of different sizes
119
120    for ( int i = 0; i < size; i++ )
121        if ( ptr[ i ] != right.ptr[ i ] )
122            return false; // arrays are not equal
123

Converting between Types

- Cast operator
 - Forces conversions among built-in types
 - Specifies conversions between user defined and built-in types
 - Conversion operator must be a non-**static** member function
 - Cannot be a **friend** function
 - Do not specify return type
 - Return type is the type to which the object is being converted
 - For user-defined class **A**

```
A::operator char *() const;
```

- Declares an overloaded cast operator function for creating a **char *** out of an **A** object

© 2000 Prentice Hall, Inc. All rights reserved.

Converting between Types

`A::operator int() const;`

- Declares an overloaded cast operator function for converting an object of **A** into an integer

`A::operator otherClass() const;`

- Declares an overloaded cast operator function for converting an object of **A** into an object of **otherClass**

- Compiler and casting

- Casting can prevent the need for overloading

- If an object **s** of user-defined class **String** appears in a program where an ordinary **char *** is expected, such as

`cout << s;`

The compiler calls the overloaded cast operator function **operator char *** to convert the object into a **char *** and uses the resulting **char *** in the expression

© 2000 Prentice Hall, Inc. All rights reserved.

Case Study: A String Class

- Build a class to handle strings
 - Class **string** in standard library (more Chapter 19)
- Conversion constructor
 - Single-argument constructors that turn objects of other types into class objects

© 2000 Prentice Hall, Inc. All rights reserved.

40

Overloading ++ and --

- Pre/post incrementing/decrementing operators
 - Allowed to be overloaded
 - Distinguishing between pre and post operators
 - prefix versions are overloaded the same as other prefix unary operators

```
d1.operator++();           // for ++d1
```
 - convention adopted that when compiler sees postincrementing expression, it will generate the member-function call

```
d1.operator++( 0 );     // for d1++
```
 - 0 is a dummy value to make the argument list of `operator++` distinguishable from the argument list for `++operator`

Case Study: A Date Class

- The following example creates a Date class with
 - An overloaded increment operator to change the day, month and year
 - An overloaded `+=` operator
 - A function to test for leap years
 - A function to determine if a day is last day of a month

© 2000 Prentice Hall, Inc. All rights reserved.

```
