

# The Basics

## AV Capture, Representation and Compression

# Digital AV Capture

**An image is captured when a camera scans a scene**

Colour => Red (R), Green (G) and Blue (B) array of samples  
Density of samples (pixels) gives resolution

**A video is captured when a camera scans a scene at multiple time instants**

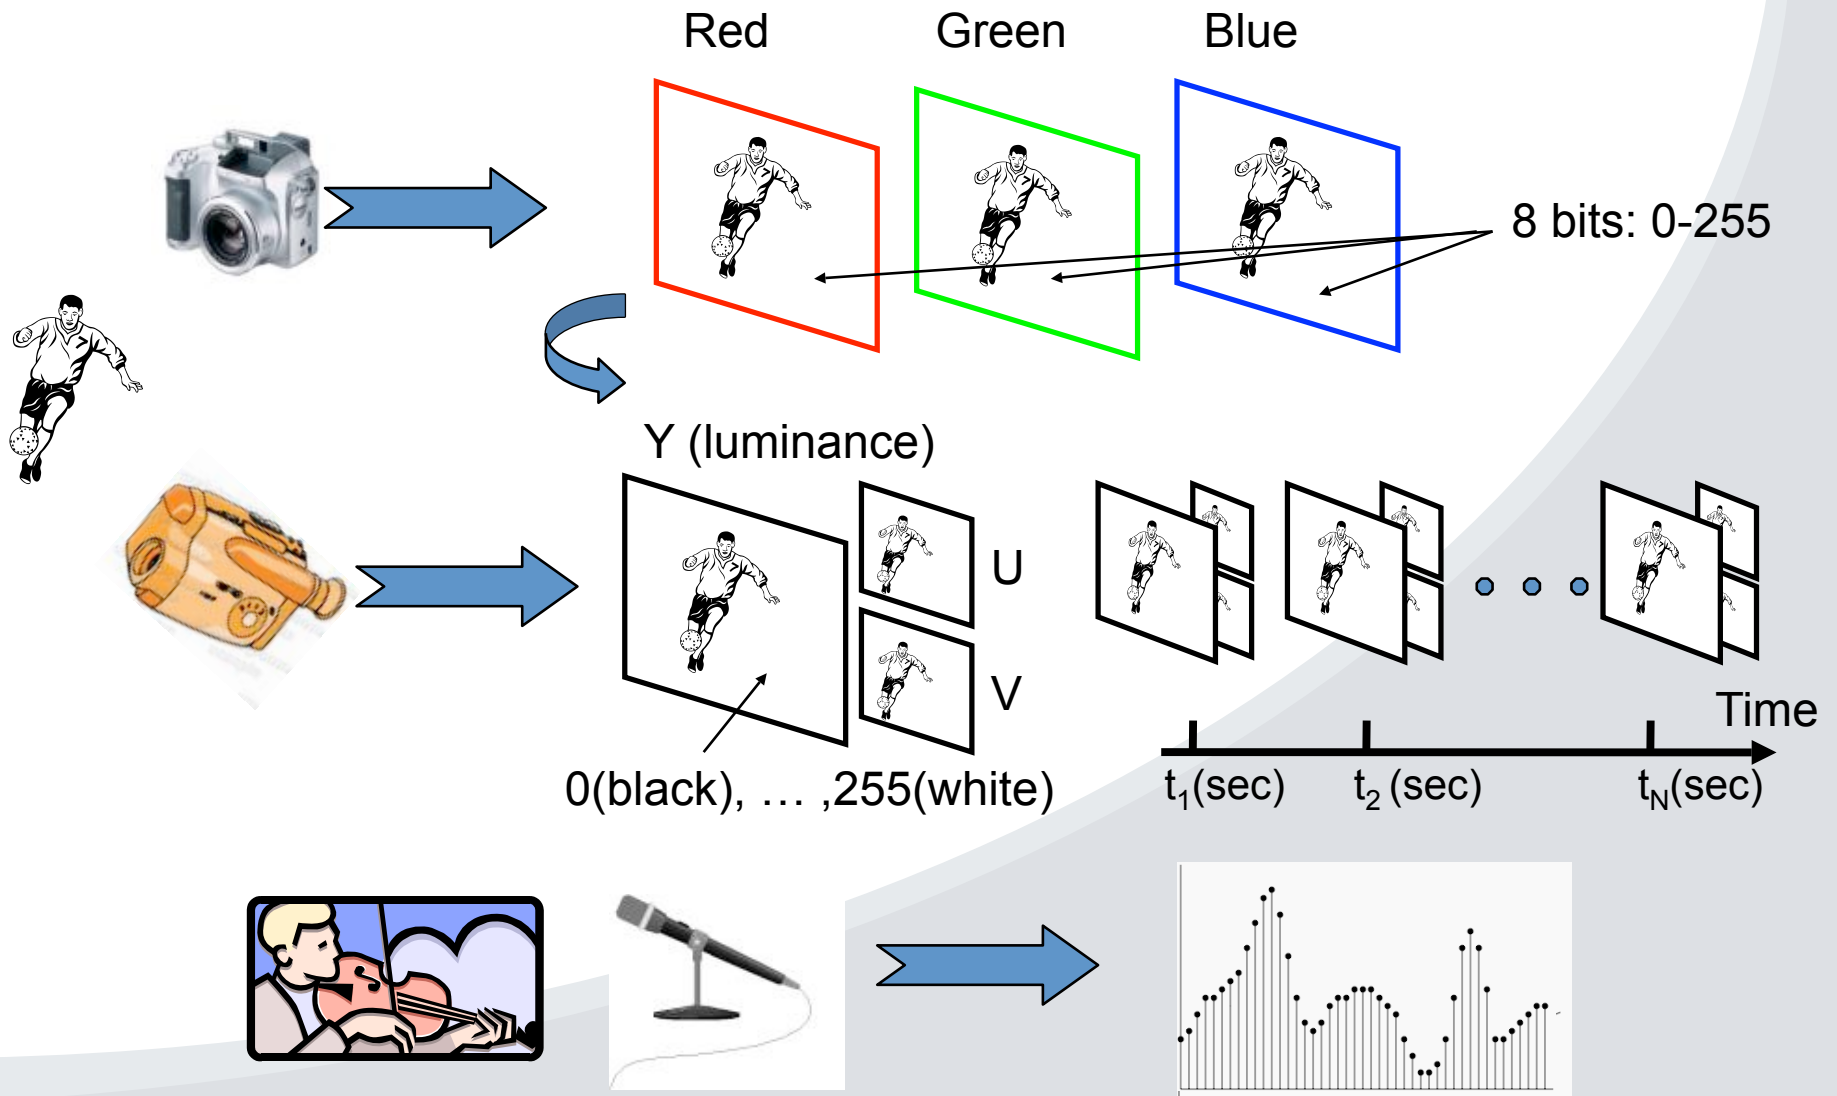

Each sample is called a frame giving rise to a frame rate (frames/sec) measured in Hz

TV (full motion video) is 25Hz

Mobile video telephony is 8-15 Hz ... jerky

**Audio is captured when a microphone temporally samples sound waves**

# Digital AV Capture

# Image Data (RGB)

## Colour still image:

420 x 315 pixels, 8 bits/  
pixel = 387KB

(R,G,B)=(153,102,204)  
(R,G,B)=(17,0,0)  
(R,G,B)=(204,153,205)

# Image Data (YUV)

RGB

Y (luminance)

U (col. diff.)

V (col. diff.)

Y=230

Y=127

**RGB & YUV are known as colour spaces**

Many different colour spaces exist

**E.g. HSV**

Hue: the color type (such as red, blue, or yellow)

Saturation: the intensity of the color

Value: the brightness of the color

See: [A.K. Jain, Fundamentals of Digital Image Processing, Prentice Hall, 1988]

# Video Data

## Desktop PC

CIF (352 x 288), 8 bpp, 30hz =  
8.7 MB/sec

30 sec clip = 261 MB

## Video to mobile device

QCIF (176 x 144), 8 bpp, 30 hz  
= 2.2 MB/sec

30 sec clip = 65 MB

## High Definition TV (HDTV)

1280 x 720, 24 bpp, 50 hz = 0.4  
GB/sec

2.5 hour movie = 3.4 TB

# Video Data

## Desktop PC

CIF (352 x 288), 8 bpp, 30hz = 8.7  
MB/sec

30 sec clip = 261 MB

## Video to mobile device

QCIF (176 x 144), 8 bpp, 30 hz  
= 2.2 MB/sec

30 sec clip = 65 MB

## High Definition TV (HDTV)

1280 x 720, 24 bpp, 50 hz = 0.4  
GB/sec

2.5 hour movie = 3.4 TB

# Compression

When captured, audio/video data is referred to as as “raw” or “uncompressed”

**Undergo software/hardware process to compact data:**

Termed “compression” or “encoding”

Results in a bitstream that can be stored or transmitted

Requires a (less) complex process to uncompress/decode before it can be displayed/heard

**Terminology:**

**Encoded data ... termed compressed domain**

Fast (real-time), simply parsing the bitstream

**Raw data ... termed uncompressed domain**

Slower (requires decode) but less restrictive

i.e. greater range of more expressive features possible

# Compression

## Two types:

Lossless: doesn't change data "simply" reorganizes

Used in medical applications (e.g. X-Rays) and document scanning (e.g. FAX)

Lossy: throws some data away during encoding

Used in most multimedia applications

## Popular AV compression standards

JPEG (still images)

JPEG 2000 (enhanced functionality/quality)

MPEG-1 (video from CD-ROM)

MPEG-2 (digital TV, DVD)

MPEG-4 (mobile and content-based functionality)

H.264 (advanced video coding)

Note: MP3 = MPEG-1 layer 3 audio encoding

# Image Compression

## Use frequency domain analysis

The discrete cosine transform (DCT)

- Spatial Domain
- Highly Textured
- Fine Detail

- DCT Domain
- Energy Compaction
- Less information to store or transmit over network

- Low Pass Filter
- Ignore high frequency info
- Even better compression

- Reconstruction
- Use Inverse Transform
- Low perceptual losses
